Submitted to the Department of Electronic and Telecommunication Engineering on March 18, 2000, in partial fulfillment of the requirements for the degree of Master of Philosophy

Abstract

The traffic signal is one of the most common control devices used to manage highway traffic. Operating them as isolated units does not exploit their usefulness fully. An advanced system, in which traffic signals at junctions at a close proximity are coordinated, enables a more efficient method of traffic control. This thesis presents the development of hardware and software for the Uniroad traffic signal controller, for interfacing it to the proposed Advanced Traffic Control System (ATCS) for Sri Lanka, and a technique to calculate traffic plans based on the Genetic Algorithm for the coordinated system.

In hardware development, a communication interface and a general purpose input interface (GPII) are designed and implemented for the traffic signal controller (TSC). These are used to monitor the performance and change traffic plans manually or through computer control. The GPII is also used to interface vehicle detectors, pedestrian pushbutton etc. to the TSC.

The firmware platform of the TSC is developed to accommodate the requirements of both coordinated as well as individual systems. Synchronizing routines, temporary overrides and online time plan adjustments as well as error detecting and logging routines are introduced.

A control and monitoring (C&M) software package is developed for the control center. Using this package, the operation of each traffic signal controller can be monitored or optimally adjusted as needed.

A traffic plan calculator (TPC) is developed to calculate traffic plans needed for a set of coordinated traffic signal controllers. A new algorithm, based on well-known evolutionary algorithm, the Genetic Algorithm, was developed for TPC. The TPC provides an optimum set of traffic signal plans for a coordinated traffic signal system. This is a one requirement of proposed Advanced traffic Control System for Sri Lanka.

To you

.....who work for the benefit of this little island

Acknowledgements

As a multidisciplinary project, which involved both electronics and traffic engineering, this work would not be successful without the support given by various authorities and personnel. I use this little space to appreciate their contribution.

First I acknowledge with great appreciation the guidance provided by my project supervisor Dr. J.A.K.S. Jayasinghe. He gave me the maximum guidance and support throughout the project.

I wish to thank Prof. (Mrs.) I. J. Dayawansa and Dr. (Mrs.) Dileeka Dias Head/Electronics for their kind attention in continuing this project towards the M.Phill. Degree.

Although the traffic engineering aspects of the project were totally new to me, the guidance of Dr. Amal S. Kumarage and Dr. J.M.S.J. Bandera was very helpful in studying the principles of traffic engineering. I wish to express my gratitude for their invaluable help.

I would also like to thank Mr. K.K.S. Chandana Perera for designing the nice user interface for the control and monitoring software.

I would like to thank the Road Development Authority (RDA) and Road Development and Construction Company (RCDC) for providing funds for the project, for providing transport facilities whenever we needed without hesitation and for providing us traffic controllers for the experimental work I especially thank Mr. G.A.M. Sumanasekara (DGM/Mecanical, RCDC) for his kind cooperation offered for the upliftment of this project. I also thank Mr. Santha Kumara Gamage for his sincere cooperation offered throughout the project.

Special thanks are due to Mr. Wasantha Ranjewa of RCDC who provided us enormous support for the project by always being with the project. His ideas were extremely helpful in developing the traffic signal controller.

I also thank Mr. Jayantha Perera who helped me by designing and drawing required PCBs and supplying other equipment whenever needed.

Thanks are due to my good friends in the research lab Ranaweera and Nuwan for helping me in many ways to make this project a success. I also thank Mr. Senadeera for help offered to me throughout this project. Mr. Thushara and Mr. DD Sumanapala are also remembered for spending their time after working hours to keep the research lab open.

I, finally, thank all the people who didn't mention here but helped me in various ways to make this research a successful one.
