IMPACT OF INTERNAL AND EXTERNAL FACTORS IN BUILDING ENERGY CONSUMPTION IN SRILANKA

A dissertation submitted to the
Department of Electrical Engineering, University of Moratuwa
In partial fulfillment of the requirements for the
Degree of Master of Science in Electrical Installations

University of Moratuwa, Sri Lanka.

DECLARATION

The work submitted in this dissertation is the result of my own investigation, except where otherwise stated.

It has not already been accepted for any degree, and is also not being concurrently submitted for any other degree.

Abstract

This research describes work that covered both theoretical and practical aspects of impact of internal and external factors in building energy consumption. It gives a brief introduction of various concepts related to psychometric and cooling load of air-conditioning system which is useful for an energy optimization in building.

Various mathematical and graphical models were developed to assess the impacts and implementation issues.

An economic analysis was also carried out to help prospective users on energy savings ideas.

In addition to the direct financial savings on energy bills, various other indirect benefits to the building and environment such as extended life time of air conditioning unit reduced emission and pollution, fewer burdens on the national utility grid etc.

Dedication

The basic idea behind this research work is to identify various possibilities, to conserve energy on an air conditioning system. Various energy optimizations were identified through mathematical modeling. Mathematical equations were derived related to the scope of the research and compared common material used in building envelope.

My dedication was focused to building envelope which is transfer media. This passes heat from outdoor to indoor and indoor to outdoor.

Results of this research may contribute to future improvements in energy consumption of buildings in srilanka.

Acknowledgement

First of all, my gratitude must go to my principal supervisor, Dr. J. P. Karunadasa who believed in my ideas and empowered me to achieve this goal. His kind support, encouragement, advice and guidance are most greatly appreciated. My sincere thanks also goes to faculty members/my lecturers, Dr. Narendra De Silva and Dr. R. U. Halwathura for their understanding and supportive role in my academic works. Their advice, remarks and encouragement are most greatly acknowledged. The advice of Mr. D. G. R. Fernando is also greatly appreciated.

I also wish to acknowledge the generous support, assistance and encouragement of several friends and staff members of University of Moratuwa. In particular, my special thanks go to Mr. M. G. M. S. Udayashantha for helping in various ways to clarify things and solving some problems. My appreciation also goes to my post graduate collegeous for creating such a harmony, inspiring and supporting environment where I really enjoyed being part of it.

I am grateful to my mother and father for all their support and encouragement. In particular, to my wife Mrs. Kumari Perera who lives in many miles away but never failed to show her moral support encouragement. My family's expectation, sacrifices, understanding and support enabled me to fulfill my dream.

3.1 Room heat gain component	6
3.2 Psychometric Chart	21
3.3 Process of air-conditioning system	23
3.4 Inside view of simulated models	26
3.5 Simulated model appearance	27
3.6 View of roof in simulated building	31
3.7 View of floor in simulated building	32
3.8 Peak cooling load for different walls through Square meter area	37
3.9 Linear regression of A and B for walls	38
3.10 Error in peak cooling load in Btu/h per square feet area for walls	39
3.11 peak cooling load for different timber material through square meter area	41
3.12 Linear regression for A and B for timber	42
3.13 Error in peak cooling load in watts per square feet area for timber	43
3.14 Peak cooling load variation for different glasses through square meter area	44
3.15 Glass load factor for different glasses	45
3.16 Peak cooling load variation for different roofs through per square feet area	46
3.17 Peak cooling load variation through different floors per square meter area	46
3.18 Cooling load in watts with respect to number of peoples	47
3.19 Cooling load in watts with respect to floor area in m ²	47
3.20 Simulated residential house	48
4.1 Different improved architectural view	67
5.1 Plan view of supermarket	68

5.2 Sketch of air conditioning process for one brick layer type	74
5.3 Application of psychometric chart for one layer brick type	75
5.4 Sketch of air conditioning process for improved wall type	77
5.5 Application of psychometric chat for improved wall type	78
5.6 Sketch of air conditioning Process for plain glass type	85
5.7 Application of psychometric chart for plain glass type	86
5.8 Sketch of air conditioning process for double glass type	88
5.9 Application of psychometric chart for double glass type	89
6.1 Changes in A/C due to RSCL change	94
6.2 Electricity prices with respect to RSCL for different consumers in Srilanka	97
6.3 Net pay back period for both selected glass and wall	98
