Thesis submitted in partial fulfillment of the requirements for the degree of Master of  
Science in Artificial Intelligence

Department of Computational Mathematics

University of Moratuwa

Sri Lanka

May 2017

## Declaration

I declare that this dissertation does not incorporate, without acknowledgment, any material previously submitted for a degree or a diploma in any university and to the best of my knowledge and belief, it does not contain any material previously published or written by another person or myself except where due reference is made in the text. I also hereby give consent for my dissertation, if accepted, to be made available for photocopying and for interlibrary loans, and for the title and summary to be made available to outside organization.

Name of student:

## **Acknowledgements**

I would like to make this opportunity to express my sincere gratitude to my supervisor prof. Asoka Karunananda for his valuable guidance extended throughout the research. This research would not have been completed to success without his immense support and guidance. Further, I would like to thank ASP Mr. T.P. Gamlath, Director of the police CCTV division, Sri Lanka for agreeing to provide video surveillance data in Colombo roads to carry out this research as well as for motivating me by emphasizing the importance of this research. Also, I would like to convey special gratitude to Kaushalya Madhawa and my friends Abi Sachithanatham, Randima Hettiarachchi, Sameera Thilakasiri and Dinesh Asanka for their continuous assistance whenever needed. Last, but not least I would like to thank my parents for their invaluable support and guidance through out my life.

# Abstract

Transportation has been a crucial aspect of human life for decades. Road traffic congestion is a critical socio-economic issue as it causes high fuel consumption, waste of time, increased environmental pollution, frustration and safety issues. Major cause for increased road traffic congestion is the sub-optimal use of available resources such as time and road space due to the fixed traffic signal plan. Traffic density at multiple adjacent intersections is not considered in current traffic signal plans.

The said problem is formulated as a distributed constraint optimization problem in this research. Optimized road traffic control mechanism, based on dynamic traffic conditions in multiple adjacent intersections is proposed. The goal is to attain the emerging effect of minimizing the passenger time loss due to traffic congestion of a selected area over time. This is achieved by permitting the optimal green time eligibility for each controlled link in a given intersection during traffic signal phase and cycle length design in a conflict free manner. Multi agent technologies are used to facilitate the communication and coordination between multiple adjacent intersections. Two types of agents namely CCTV agents who monitor the traffic density and traffic signal light agents who control the traffic flow are introduced. Two multi agent based algorithms namely individual lane based traffic signal control and cumulative intersection based traffic signal control are proposed to determine the optimal green time eligibility for a given intersection considering the traffic density of the incoming and outgoing lanes of multiple adjacent intersections. Convolutional Neural Networks (CNNs) is applied on video surveillance data to recognize the traffic density of adjacent intersections.

Real world video surveillance data in Sri Lankan roads are used to evaluate traffic density recognition. Simulation of Urban Mobility (SUMO) traffic simulation suite is used to assess the proposed dynamic traffic control optimization mechanism. Experimental results show that the proposed traffic signal plan effectively reduces the time loss due to traffic congestion for a given area by 34% compared to the fixed traffic signal plan. Accuracy of the traffic density recognition is 72%.

# Contents

<b>Chapter 1 Introduction</b>	<b>1</b>
1.1 Prolegomena	1
1.2 Background and motivation	1
1.3 Road traffic congestion problem in brief	3
1.4 Novel approach to real time intelligent traffic control optimization	4
1.5 Aim and objectives	4
1.6 Resource requirements	4
1.6.1 Hardware	4
1.6.2 Software	5
1.7 Structure of the thesis	5
1.8 Summary	6
<b>Chapter 2 Intelligent Traffic Control Optimization: State-of-the-art</b>	<b>7</b>
2.1 Introduction	7
2.2 Traffic density recognition	7
2.2.1 On road sensors	7
2.2.2 Inter-vehicular communication	8
2.2.3 Multimedia sensors	11
2.3 Traffic control optimization	14
2.3.1 Fixed traffic signal control	15
2.3.2 Adaptive traffic signal control	15
2.4 Summary	16
<b>Chapter 3 Artificial Neural Network and Multi Agent Systems</b>	<b>18</b>
3.1 Introduction	18
3.2 Artificial Neural Networks (ANN)	18
3.2.1 Deep learning	21
3.3 Multi Agent Systems (MAS)	23
3.3.1 Intelligent agent	23
3.3.2 Characteristics of multi agent systems	23

3.3.3	Agent communication and interaction	24
3.3.4	Swarm intelligence	24
3.4	Summary	25
<b>Chapter 4 Novel Approach to Intelligent Traffic Control Optimization</b>		<b>26</b>
4.1	Introduction	26
4.2	Hypothesis	26
4.3	Inputs	26
4.4	Output	27
4.5	Process	27
4.6	Non functional requirements	27
4.7	Users of the system	27
4.8	Summary	28
<b>Chapter 5 Design of Intelligent Traffic Control Optimization system</b>		<b>29</b>
5.1	Introduction	29
5.2	High level design	29
5.3	Traffic density recognition	30
5.3.1	Training	30
5.3.2	Classification	31
5.4	Traffic control optimization	31
5.5	Summary	35
<b>Chapter 6 Implementation of the Proposed Solution</b>		<b>37</b>
6.1	Introduction	37
6.2	Traffic density recognition	37
6.2.1	Caffe: Convolutional Architecture for Fast Feature Embedding	37
6.2.2	Data acquisition	37
6.2.3	Data preprocessing	39
6.2.4	Training artificial neural network	40
6.2.5	Classification of traffic scenes	42
6.3	Traffic control optimization	42
6.3.1	Jade: Java Agent Development Environment	42
6.3.2	SUMO: Simulation of Urban Mobility	43
6.3.3	Integration of SUMO with JADE	45
6.4	Traffic control optimization using SUMO and Jade	46

6.5	Summary	46
<b>Chapter 7 Evaluation of the Proposed Solution</b>		<b>47</b>
7.1	Introduction	47
7.2	Experimental design	47
7.2.1	Traffic scene datasets	47
7.2.2	Evaluation strategy for traffic density recognition	48
7.2.3	Traffic control optimization	48
7.3	Experimental results	50
7.3.1	Traffic scene classifier results	50
7.3.2	Traffic control optimization results	51
7.4	Summary	51
<b>Chapter 8 Conclusion and Future Work</b>		<b>53</b>
8.1	Introduction	53
8.2	Concluding remarks	53
8.3	Limitations and future work	54
8.4	Summary	54
<b>References</b>		<b>56</b>
