ABSTRACT

The cities have a unique character like a person have his or her own identity

But due to the lots of contemporary development trends which make the cities look more characterless loosing its identity make more uncomfortable to the physical attributes and the functional aspects as well and identifying the stress imposed to the city and its components is a realistic approach. To curb this haphazardness it is advisable to identify the actual impact towards the whole city structure and its character after the post development trends.

The development trends have to be implemented in a very effective manner in order to see the city have the physical and functional activities more well arranged in the future in order to have the society keeping it's original architectural characteristic while giving away lots of means and ways to the development trends which will be taken place in the future.
