DECLARATION

I declare that this thesis is my work and to the best of my knowledge and belief there is no any material incorporated therein previously submitted for a Degree or Diploma in any other University or institute of higher learning, without giving the proper acknowledgement to that effect. It also does not contain any material previously published or written by another person except where due acknowledgement is made in the text.

Also, I hereby grant to the University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part, in print, electronic or other media. I retain the right to use the content of this thesis in whole or part of that in my future works (such as articles or books).

ABSTRACT

Automatic load balancer is power electronic based equipment that balances the unbalanced current in the distribution transformers. This is achieved by employing an AC /DC/AC bidirectional current controlling system. The basic principle of this equipment is to draw currents from lightly loaded phases and inject it to heavily loaded phases in such a way that the currents in three phases at the transformer are balanced.

The Automatic Load Balancer proposed in this research consists of a main controller and a bidirectional-inverter. The main controller monitors the current in each phase and computes the unbalanced current that should be injected to or drawn out from individual phases. The computed currents are then injected or delivered as appropriate through the bidirectional-inverter using current control PWM. Therefore, any unbalance in current caused by the loads is rapidly and successfully corrected to ensure balanced three-phase currents at the transformer output, all the time.

Performance of the load-balancer was tested under both the steady-state and dynamic unbalanced current conditions. The results showed excellent performance under both conditions. Thus, the developed load-balancer is a sustainable and advanced solution for the rough manual load-balancing done at present.

ACKNOWLEDGEMENT

First and foremost, I would like to express my sincere gratitude to my project supervisors, Prof. J.P. Karunadasa and Prof. W.D.A.S Wijayapala in the Department of Electrical Engineering at University of Moratuwa, for their continuous support in my M.Sc. Studies and research. Their patience, motivation, enthusiasm and guidance have been the source of inspiration behind my success.

I would also like to thank academic staff members of the Department of Electrical Engineering for their encouragements and insightful comments during progress review sessions.

I would like to express my sincere gratitude to Ceylon Electricity Board for the support extended to me. In particular, I thank the Heads of divisions and my peers in Ceylon Electricity Board, who provided me with their expertise knowledge. Also, I thank my office colleagues for helping me in the technical studies.

Last but not least, I would like to convey my sincere gratitude to my spouse, parents, and family members who helped me in numerous ways to achieve my targets all the time.

OBJECTIVES

The main objective of this research is to develop a power electronic based solution for automatic load balancing for a distribution transformer, and thereby to minimize distribution losses, preserving economic viability.
