Thesis/Dissertation submitted in partial fulfillment of the requirements for the degree

Master in Engineering

Department of Civil Engineering

University of Moratuwa Sri Lanka

April 2021

Declaration

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Dr.H.R.Pasindu	Date

Acknowledgement

I would like to express my sincere gratitude to my research supervisor, Senior Lecturer Dr. H.R.Pasindu for the continuous support of my study, for his patience, motivation and immense knowledge. Without his dedicated supervision and continued guidance, this thesis would not be a success. I could not have imagined having a better advisor and a mentor for my postgraduate studies.

I will never hesitate to convey my thanks to the course coordinator Dr. Loshaka Perera by extending all the necessary help. He was kind enough to provide help and support with his busy schedule. His sincere and consistent encouragement is greatly appreciated.

I would also like to thank University of Moratuwa for giving me this opportunity to study towards a Master of Engineering in Highway and Traffic Engineering, at Department of Civil Engineering, University of Moratuwa, Sri Lanka.

I am grateful to Eng.S.Weerakkon, Project Manager, (I-Road Programme, Polonnaruwa) Eng.Asiri Sriwardane, Quality Assurance Manager, (I-Road Programme, Polonnaruwa) and the staff of Material Laboratory, Tissa Builders & Contractor for their help and support all the way during this research.

My sincere thanks should extend to Eng.P.Sivarajh, Resident Engineer, (I-Road Programme-Polonnaruwa), Resources Development Consultant (Pvt) Ltd, Sri Lanka, for giving me this opportunity to follow this Master Degree course.

I would also like to thank Eng.S.Sirinivasan, Project Director, (I-Road Programme-NCP), Road Development Authority, Sri Lanka, for giving me this opportunity to follow this Master Degree course.

Finally, I must express my heartfelt gratitude and love to my father for providing me with the unfailing support and continuous encouragement throughout this research and having faith on me throughout this course.

Abstract

Improvements of rural roads are active socio-economic passageways to a high quality of life for most of the Srilankan people living in rural areas. The fund allocated for low volume road project is limited, thus it is important to use existing resources for economic advantages. Also, adverse environmental impact can be reduced. Roads are designed for low-volume traffic and are constructed of local soils containing high percentages of fines and high indices of plasticity. These type of soils may not have certain properties pertinent for the sub base in the construction of flexible pavement in rural roads. Thus, it is necessary to modify or stabilize this kind of soil to make it suitable for construction. The soil modification process can be effectively used to meet the challenges of sustainability of the environment, to minimize the adverse effect of industrial wastes such as plastic, glass, paddy husks, etc. Wastes are multiplying day by day leading to diverse environmental concerns. On the account, the disposal of those wastes without causing any environment hazards is a real challenge. Therefore, using plastic waste, glass waste & paddy husk ash stabilizing agents is an economical utilization since there are demand and shortage of well graded soil for sub-base. This research involves a comprehensive study on the feasible use of the waste products for soil stabilization for the sub-base material in the North Central Province I-Road Project in Sri Lanka.

A series of field and laboratory tests were carried out for collected sub-base materials to identify the deficiency of sub base material properties. CIDA specification for the roads was referred and confirmed to the specification for the road projects in Sri Lanka. The specification says that Liquid Limit should be less than 40 (LL<40) and Plasticity Index should be lesser than 15 (PI<15). Three different borrow pits Subbase materials from Polonnaruwa area were stabilized with different percentage of paddy husk ash, plastic waste and glass waste with weight-based mix proportions. But the experimental study of two sub base borrow pits samples such as Mahadamana source and Sooriyaweva source demonstrated that with a 8% and 10% of optimum paddy husk ash. At the same time, the two composite samples from Mahadamana source and Sooriyaweya source were reduced the Liquid Limit by 20%, 26% and reduced the Plastic Index by 26%, 36 % accordingly. Similarly, California Bearing Ratio of the Mahadamana and Sooriyaweva composite samples were improved by 10% and 14.7% respectively. Finally, it was concluded that the stabilized composite soil can be used for the construction of flexible pavement in rural areas with low volume traffic.

Keywords: Sub-base, Stabilization, Liquid Limit, Plastic Index, Wastes, Paddy Husk Ash
