DECLARATION

I declare that this is my own work and this thesis does not incorporate without ac-

knowledgement any material previously submitted for a Degree or Diploma in any

other University or institute of higher learning and to the best of my knowledge and

belief it does not contain any material previously published or written by another per-

son except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce

and distribute my thesis, in whole or in part in print, electronic or other medium. I

retain the right to use this content in whole or part in future works (such as articles or

books).

ABSTRACT

In emergency situations, heart disease patients who live in remote area with little to no ac-

cessibility for proper healthcare services are at risk of not receiving proper and/or immediate

care due to issues such poor network reception and language barriers. In urban areas too, pa-

tients do not always receive the medical intervention that they need, potentially for reasons

including undermining the severity of the illness in question or delays in contacting relevant

medical professionals. This thesis investigates the use of a mobile-cloud system, to minimize

delays in receiving medical care for heart disease patients. The proposed method to achieve

this, involves the use of a Low Power Wide Area Network (LPWAN), using the Long Range

(LoRa) protocol to connect several patients over a large area to a centralized server. Each pa-

tient would be provided with a Wireless Sensor Node that contains the technology to connect

to a central node, as well as sensors to detect the patient heart rate and also the location of the

patient. To transmit data from nodes to the server, the network does not use the Long Range

Wide Area Network (LoRaWAN) protocol, but rather uses its own MAC layer implementa-

tion that allows for the creation of a location based opportunistic network using LoRa nodes.

Data that the central server receives will be forwarded to the cloud where it will then be ana-

lyzed in real time, and this data can be viewed on a dashboard by medical professionals. This

thesis attempts to further the existing understandings of the limits of the LoRa protocol, and

the impact of varying parameters of the network while also adding to the research done on

opportunistic networks using the LoRa protocol. The results show that a LoRa network can

be successfully utilized for such an application.

Keywords: LPWAN, LoRa, Mobile-Cloud

ACKNOWLEDGEMENT

I would like to take this opportunity to extend my heartfelt appreciation to all the numerous people who have helped me to successfully complete this research.

First and foremost, I would like to express my deep gratitude to my research supervisor, Dr. Kutila Gunasekera for his valuable support and guidance throughout the duration of this research.

My gratitude also goes out to all my lecturers over the past few years, who have all imparted invaluable knowledge and learning to me. Your constant guidance from the start of my Masters journey, has been truly instrumental in making me into who I am today.

My sincere thanks also go out to my batchmates and colleagues at my workplace for all their wholehearted support during the duration of this thesis and the MSc degree.

Finally I would like to thank my parents for encouraging and supporting me in following this Masters program. Last, but not least, my profound thanks go out to my extended family, friends and well-wishers for all their unconditional love, support and faith in me, which have always motivated me to work hard and achieve my goals.
