## ACKNOWLEDGEMENT

I express my highest gratitude to Prof. J.M.S.J. Bandara, Research Supervisor and Dr. W.K. Mampearachchi, Course Coordinator, M. Eng. in Highway & Traffic Engineering, Department of Civil Engineering, University of Moratuwa for guiding me in carrying out the project and preparing this report.

I wish to thank Road Development Authority Chairman, Director General and the Project Director, Asian Development Bank Funded Projects for sponsoring me for this post graduate programme and granting me leave and also thank the retired General Manager- SLR Mr. Priyal De Silva, the Chief Station Master and his technical staff of Sri Lanka Railways for supporting me to collect data. Further to this I shall be thankful to the staff of Traffic and Planning Division of RDA for facilitating me relevant requirements in order to make my survey works successful and also the staff of Asian Development Bank Funded Projects office of RDA for assisting me in preparation of this report.

## ABSTRACT

Design, construction and maintenance of railway level crossings are responsibilities of Sri Lanka Railways. The funding agency in this regard is the Ministry of Finance where allocations are provided from the annual budget for above targets.

The additional time consumption born by the road users at level crossing is a current issue to be addressed at the earliest possible in order to minimize the delay and inconvenience. According to the SLR the reason behind in this issue is the poor maintenance due to inadequacy of budgetary allocations provided by the Central Government. Also the officials of SLR highlighted that they do not have sufficiently equipped laboratories or skilled technical staff for doing research and also the application of advance high tech equipment such as sensors and replaceable surface materials. One of the main reasons behind in this issue is the high capital cost of implementation of said needful.

Under this research around 125 locations of level crossings were visited all over the country where the faults and weaknesses influenced for delay was carefully observed. A random sample of 42 numbers of crossings (including good and bad sections) was selected for evaluation. The prominent causes detected were categorized for quantitative analysis. The locations contributed with high gravity on delay and safety such as Yangalmodara, Kolathenna, and Kapuwatta were taken as case studies and compared with the level crossing at Bentota which can be considered as the best out of 125 level crossings observed. Since the comparison was not that easy as the parameters such as number of rail tracks, traffic flows, type of crossings etc. differs from place to place it was decided to compare the delay per vehicle for 100m distance (50m distance from either sides of centre lines of the tracks) with the time taken by an average vehicle to travel the same distance in the particular area.

The parameters mostly influenced for delay were cross tabulated. The correlations were checked among the parameters. The gravity of causes was assessed by giving a rating (1-3) at different locations.

Furthermore this discussions were made with the responsible officers of Sri Lanka Railways and Road Development Authority.

With the help of the information gathered from the two organizations and also with the data collection and the evaluations carried out during the research it was able to forward some improvement proposals/ mitigation measures in order to minimize the delay at level crossings in Sri Lanka. It is suggested that based on rough quantitative and acceptable qualitative analysis given in this dissertation the designers and responsibility bearers of relevant authorities would be able to carry out their designs or construction/ maintenance activities successfully.

It was found that the main parameters causing for this delay are visibility, surface defects and poor vertical alignment in approaches and in between tracks due to settlement or in proper designs implemented at level crossings.

## Chapter 1 BACKGROUND INFORMATION

1.1	Introduction	1
1.2	Problem Statement	2
1.3	Objectives	2

## Chapter 2 LITERATURE SURVEY

2.1	History of Railway and level crossing development	4
2.2	Railway crossings and design standards	6
2.3	Crossings around the world	8
2.3.1	Australia	8
2.3.2	United Kingdom	8
2.3.2.1	Pedestrian crossings in UK	10
2.3.3	United States	10
2.3.4	Belgium	13
2.3.5	Canada	13
2.3.6	New Zealand	14
2.3.7	Sweden	14
2.3.8	East and South Asia	15
2.3.9	Taiwan	15
2.4	Innovations	16
2.5	Different types of crossing and related appliances	17

## Chapter 3 DATA COLLECTION

3.1	Rail Network in Sri Lanka	24
3.1.1	The systems adopted for data collection	24
3.2	Types of level crossings in Sri Lanka	25
3.3	Details of surveys and data collection	27
3.3.1	Surveys for delay issue	27

3.3.2	Surveys for risk of safety	28
3.3.2.1	Selection of the crossing type	29
3.3.2.2	Occupational level crossings	30
3.3.2.3	Construction of parallel road sections In place of direct right angle crossings	31
3.3.2.4	Replacing unprotected crossings by signal Lights and gates	32
3.3.2.5	Implementation of ITS applications	33
3.3.2.6	Safety assurance of pedestrians	33
3.4	Observations Gathered during Inspection	33
3.4.1	Common causes for delay at level crossings	33
3.4.2	Demand for crossings	36
3.4.3	Demand for railway Vs road transport	36

## **Chapter 4 DATA ANALYSIS**

4.1	Introduction	38
4.2	Identification of reasons causes of delay	42
4.2.1	Use of SPSS & excel packages for Analysis	42
4.2.2	Analysis of combined effects	42
4.2.3	Cross tabulation and Correlation Analysis	42
4.2.4	Calculation of time taken for different causes of delay	44
4.3	Sample Calculation	44
4.4	Findings and General Comments	45
4.4.1	Most effective causes for delay	46
4.4.2	Absence of pedestrian and cycle paths at crossings	47
4.4.3	Delay effect during peak hours	47
4.4.4	Compression of delay at controlled level crossings with Uncontrolled crossings	48
4.4.5	Comparison of Estimated Delay with the Total Rates	48

## **Chapter 5 PROPOSALS FOR IMPROVEMENTS**

5.1	Construction of level crossing surface jointly with the Road Development Authority	55
5.2	Application of concrete or high tech materials on surface area	56
5.3	Implementation of proper designs for construction of approaches	56
5.4	Introducing ITS applications	58
5.5	Introducing level crossing management systems in place of Periodic maintenance	58
5.6	Improvements to the Alignment	59
5.6.1	New construction	59
5.6.2	Improvements to the Existing level crossings	59
5.7	Enforcing of regulations on unauthorized construction	59
5.8	Implementation and maintenance of proper drainage system	60
5.9	Consideration of correlations among parameters for design	61
