## **DECLARATION**

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

## ABSTRACT

Sri Lanka receives an average annual rainfall varying from 900mm to 6000mm. However, the rainfall is not distributed equally over the island. Hence, traditionally, the country is divided into three main climatic zones as wet zone, dry zone and intermediate zone. Two thirds of the island is occupied by the dry zone, which receives less than 1750mm of average annual rainfall. The dry zone periodically has faced water stress conditions from the past, and Hambantota District appears to be a severely affected area, on the basis of surface water availability. With the ongoing development projects, the demand for water in the district will increase in the next few years.

Therefore, implementation of a proper water management system as well as preservation of existing surface and groundwater resources is essential to overcome this problem.

A methodology is developed to find the most suitable locations for water harvesting structures in Hambantota District by using Geographic Information System (GIS) techniques. Suriyawewa Divisional Secretariat area is selected as the research area considering its average climatic conditions and location within Hambantota District. This methodology can be generalized to the whole District in the first instance.

The research area is hydrologically analyzed to discretize the area into catchments and the preferred catchments to harvest the runoff based on surface area, slope and rainfall are found by using GIS techniques. The selected catchments are then analyzed with geological data and drainage characteristics to find the most suitable catchments to construct reservoirs to store rainwater. The analysis yields four such locations, which were subsequently field verified for spatial accuracy. However detailed local investigations are necessary before proceeding to actual construction of the reservoirs.

Groundwater recharging also plays an important role in water management, as groundwater represents 30.1% of the world's fresh water resources. GIS techniques are employed to integrate data on land use, climate, soil, stream pattern and ground slopes, and consequently to find potential areas for groundwater recharging. Here also, detailed local investigation must precede any construction work in the selected areas.

Also, potential areas to implement roof water harvesting projects in Suriyawewa are found by analyzing the rainfall and building cover by using GIS techniques. These areas are recommended to be used as project areas when implementing efficient roof water harvesting methods.

The methodology adopted here for Hambantota District can be used for water management in other Districts of the Dry Zone of Sri Lanka such as Monaragala, Puttalam, Ampara, Badulla and Kurunegala, as a solution for water stress conditions in those areas. An increment in water harvesting can significantly increase the crop yields in these areas and improve the economy as most of the Districts in the Dry Zone are agriculture-based. Also, a proper water management system is a must for the industrial development of the area under focus, while it gives a solution to the problems regarding drinking water. Proper water supply plays a major role in infrastructure development of these areas and would form the foundation for the overall development of the country.

## ACKNOWLEDGEMENTS

Foremost, I would like to express my sincere gratitude to my supervisors, Prof. U.G.A. Puswewala, Professor at Department of Civil Engineering and Dean of the Faculty of Engineering, University of Moratuwa, and Dr. D.M.D.O.K. Dissanayake, Senior Lecturer at the Department of Earth Resources Engineering, University of Moratuwa and Chairman of the Renewable Energy Authority. Without their immense guidance and persistent help this dissertation would not have been possible.

The research presented in this thesis was carried out at the Department of Earth Resources Engineering, University of Moratuwa under the financial assistance from the University Research Fund. I would like to thank the University of Moratuwa, and the Senate Research Committee for the financial assistance extended.

Beside my supervisors, I would like to thank the chairman of the progress review committee, Prof. S.A.S. Kulatilake, for his encouragement and insightful comments.

I would also like to thank Prof. R.A. Attalage, Director of the Postgraduate Studies Division, University of Moratuwa and his staff for their support.

My sincere thanks also go to Dr. (Mrs.) S.C.S. Karunaratne, Head of the Department of Earth Resources Engineering and Dr. A.M.K.B. Abeysinghe, Research Coordinator at the Department of Earth Resources Engineering, University of Moratuwa, for their kind support.

I owe my deepest gratitude to Mrs. W.L. Gunawardena, Lecturer at the Department of Town and Country Planning, University of Moratuwa for her kind assistance on Remote Sensing and GIS software during this research.

It is with immense gratitude that I acknowledge the support of late Surveyor General Mr. B.J.P. Mendis, Additional Surveyor General Mr. K. Thawalingam and the staff of the Survey Department of Sri Lanka for providing me the digital data of Suriyawewa at a concession.

I am indebted to the staff of Meteorological Department of Sri Lanka, Geological Survey and Mines Bureau and the Irrigation Department of Ambalantota for providing me with the required climatic, geological and irrigation data respectively for this research.

I am grateful to the academic and non-academic staff of the Department of Earth Resources Engineering, and the Department of Civil Engineering, University of Moratuwa for their guidance and support.

Also, I wish to thank library staff and the staff of Examination Division of University of Moratuwa for their help during the work.

My gratitude goes to all the authors and publishers of the literature I used, in this work.

In the field, residents of the study area helped and gave me essential details. I highly acknowledge their support with immense gratitude.

I express my heartfelt gratitude to my parents, family and friends whose moral and emotional support helped me immensely.

Last but not the least, I would like to acknowledge and extend my heartfelt gratitude all of those who supported me in any respect during the completion of this research.
