Contributions by others to the thesis

My supervisors Dr. Pujitha Silva and Dr. Thilini Gunasekara, have given the necessary advice, reviewed this thesis, and provided editorial suggestions.

Ms. Chathurani Dias has assisted with getting pressure insole readings.

Acknowledgment

I acknowledge with gratitude to my supervisors Dr. Pujitha Silva and Dr. Thilini Gunasekara who went beyond to make sure that this thesis was always on the right track. Their advice and valuable feedback helped me make this research a success.

I would also like to thank, National science foundation (NSF) for providing funding for this research under the grant number RPHS/2016/DTM 02, and Dr. Anjula de Silva provided great support in providing necessary funding and advice as principal investigator of NSF funding, the top-up funding provided under the SRC grant number SRC/TP/2017/04 for one year was immense support to the continuation of the research works. Further thanking goes to the Electronic and Telecommunication Engineering department and head of departments Prof. Rohan Munasinghe and Dr. Nuwan Dayananda for approving documentation works and providing working space with a computing facility.

I gratefully acknowledge the Chemical and Process Engineering Department heads Dr. (Mrs) S.H.P. Gunawardena and Prof. S. Walpalage for providing chemical synthesis facilities. The Technical officers Mrs.I.K.Athukorala, W.S.M de Silva and Lab attendants Mr.H.L.G.S Peiris and Mr.D.S. Dayananda provided immense support during the synthesis process. The Materials science and engineering departments provided chemical analysis testing facilities and I would like to thank the head of the department Mr V.S.C.Weragoda for giving fast approval for using the testing facility. Special thanks go to Dr. Pujitha Silva, Director, Center for Biomedical Innovation (CEBI), the University of Moratuwa for providing Tactilus pressure insole to test pressure distribution effectiveness.

I am grateful to Prof. Ruwan Gopura and Dr. Himan Punchihewa heads of the Mechanical Engineering department for the permission given to use mechanical testing facilities and help given by Ms.T.L.K. Kumari, Technical Officer, and W.L. Kumara, Lab attendant to operate the universal testing machine.

I sincerely thank my family for the support and continuous encouragement.

Abstract

This research considered an extensive study of double network poly (acrylic acid) and single network polyacrylamide hydrogel as an insole material for the diabetic foot by testing on compression strength, stress relaxation, compression fatigue, shear stress, and shock absorption properties. The previous studies on hydrogel fatigue were mainly focused on fatigue fracture in tension and crack propagation. This study focuses on the mechanical behaviour of hydrogels under diabetic foot-specific loading conditions. The expected testing conditions include minimum 20 000 fatigue cycles under maximum compression stress of 250 kPa at a 200 mm/ min strain rate.

The hydrogel synthesis and testing started with double network poly (acrylic acid) hydrogel. The developed double network poly (acrylic acid) hydrogel displayed fatigue properties up to 3000 loading cycles at maximum stress of 390 ± 30 kPa. Further, maximum average shear stress and shear modulus of 80 kPa and 140 kPa respectively were observed at 84% strain before fracture.

Developed Single network polyacrylamide hydrogel displayed good fatigue properties up to 13,000 loading cycles at maximum stress of 520 ± 50 kPa and 200 mm/min crosshead speed. When the maximum stress condition was reduced to 350 ± 50 kPa, the maximum number of loading-unloading cycles was increased up to 20 000 indicating a single network polyacrylamide hydrogel capable of withstanding more than 20 000 cycles at 250 kPa.

Hydrogels showed superior recoverable and viscoelastic properties when compared with available insole materials. The developed finite element model was validated with pressure insole test data and used to investigate the pressure distribution properties and to optimize the thickness suitable for insole applications

The additional properties of a hydrogel such as high thermal capacity and structural similarity to soft tissues are seen as added advantages when compared to other insole materials to prevent re-ulceration.
