#### **ABSTRACT**

In the past less attention has been paid to the equity and public goods aspects of willingness to pay for water. The pricing of water services are an important element of urban infrastructure. The absence of good water services can cause serious public health implications as well as substandard living conditions for the affected families. Presently for most of the infrastructure development projects of water supply, studies on willingness to pay by consumers are carried out. However most of these are not successfully completed and implemented. Being a developing country it is therefore important to find out the willingness to pay for public utilities in order to optimize the resource inputs without causing too much economic hardships.

This research attempts to develop a questionnaire for WTP study, to develop equations to estimate the willingness to pay for water in the Trincomalee district. And also make recommendations to the NWSDB on conducting willingness to pay study for water by consumers. The questionnaire was developed after and extensive review of previous literatures available on this subject. Datas were collected through house hold visits to conduct the survey about willingness to pay for those receiving water through service connections, stand posts and wells respectively.

Since willingness to pay by consumers is an important part of the economic feasibility of projects in water supply, this study has made recommendations such that NWS&DB can plan and carryout WTP study accurately and easily.

### TABLE OF CONTENTS

1.	INTRODUCTION 1.1. Background	1 1
	1.2. Research Problem	5
	1.3. Research Objectives	6
	1.4. Work Done	7
	1.5 Finding	8
	1.6 Structure of Report	9
2.	LITERATURE REVIEW 2.1. Willingness to Pay	10 10
	2.2. Pricing for Municipal Water Supply	13
3.	RESEARCH METHOD  3.1. General	15 15
	3.2. Survey Methods	15
	3.2.1. General	15
	3.2.2. Abstraction from Published Data	16
	3.2.3. Postal Questionnaire	17
	3.2.4. Selected Method crait of Moratuwa, Sri Lanka.	17
	3.3. The Questionnaire	18
	3.3.1. Development	18
	3.3.2. Pilot Survey	18
	3.4. Sample	19
	3.5. Analysis of Data	20
4.	DATA COLLECTION & DATA ANALYSIS 4.1. General	22 22
	4.2. Data Collection	23
	4.3. Difficulties Encountered in Data Collection	27
	4.4. Analysis of Data	28
	4.4.1 Analysis	28
	4.4.2 Discussion	28
5.	CONCLUSIONS AND RECOMMENDATIONS 5.1. Conclusions	35 35
	5.2. Recommendations	38
6	DEFEDENCE	30

#### **ACKNOWLEDGEMENTS**

The work described in this report was done for the Master of Engineering course in construction management conducted by the Department of Civil Engineering, University of Moratuwa. My postgraduate | studies were encouraged initially by Samuel Sons & Co. Ltd., subsequently by the National Water Supply & Drainage Board. Both institutions were generous in granting duty leave to attend this course. My thanks to these institutions.

I express my deepest gratitude to Dr. Malik Ranasinghe who supervised my work, for his continuous encouragement, guidance and availability throughout this study. His kindness and support will always be cherished, working with him has been a valuable and pleasant experience.

I wish to express my sincere thanks to Dr. Asoka Perera course co-ordinator and all lecturers and batch mates for their valuable advice and discussions at the progress review seminars.

I would like to thank Mr.Sanath Ranawana, Economist, NAREP for his continuous encouragement and advise.

I would like to acknowledge invaluable support given by NWS&DB staff in preparing this report.

Very special thanks should go to my father, and mother, who gave continuous encouragement and moral support throughout my study. I am grateful to relatives who showed continuous interest in my studies throughout my career.

#### **DEDICATION**
